Windows Azure-Backup Service

THE SOLUTION

Windows Azure-Backup is a scalable solution that protects the data of your applications with zero capital investment and minimal operational costs. Through the Windows Azure-Backup platform for files and folders on computers and servers, your business is guaranteed a highly optimised backup without compromising on security.

All data is encrypted on leaving the data centre, therefore remaining on the Azure platform during transit or after storage. You can also transfer your data through high-speed connections or send your initial backups to Azure using offline propagation. Furthermore, you can manage your backups using the Azure Backup user interface console or the PowerShell client.

SERVICE SCOPE

The Windows Azure-Backup installation service offered by Westcon is aimed at small and medium-sized implementations. This service includes fast and reliable installation and configuration of the Windows Azure-Backup solution. See the service scope below:

- Configuring the Windows Azure-Backup platform.
- Configuring a single vault on Windows Azure.
- Installing and configuring a single Windows Azure Agent instance (independent of the server application to be protected).
- Creating backup routines in accordance with customer requirements.
- Carrying out of a single backup and a single restore test.
- Minimum necessary configuration: Windows 7 or higher, and previously acquired Azure credits.

SERVICE DETAILS

Part number	Description
